

Amendment to the Claims

Please amend the claims as follows:

1. (Currently amended) A device for processing the surface of an objects comprising:
~~a predetermined number of~~ at least one processing stations (B_1-B_8) performing processing processes and;
a conveying unit performing processing movements, by means of which said objects are transported into ~~predetermined~~ desired positions at said processing stations (B_1-B_8); characterized by
a central controller (7), by means of which the functions processing movements of said conveying unit and the processing processes of said processing stations are synchronized by presetting a clock pulse being correlated with the processing movement transport of the said object (3) to be processed and wherein said controlling the respective processing process via said central controller (7) controls for each processing station (B_1-B_8).
2. (Currently amended) The device according to claim 1, characterized in that wherein a predetermined number of said processing stations (B_1-B_8) is constituted by one further comprises a printing unit each.
3. (Currently amended) The device according to claim 2, characterized in that wherein at least one of said printing units further comprises an inkjet printing head (6).
4. (Currently amended) The device according to any one of claims 2 or 3, characterized in that wherein at least one of said printing units further comprises a printing roller (5).
5. (Currently amended) The device according to any one of claims 1 to 4, characterized in that wherein at least one of said processing stations (B_1-B_8) is constituted by further comprises an inspection unit.
6. (Currently amended) The device according to any one of claims 1 to 5, characterized in that rotationally symmetrical objects (3) are processed therewith, wherein said objects are symmetrical about a rotational axis.

7. (Currently amended) The device according to claim 6, characterized in that wherein said ~~rotationally symmetrical~~ objects (3) comprise are selected from the group consisting of beverage cans, beverage bottles or cups.
8. (Currently amended) The device according to any one of claims 6 or 7, characterized in that wherein said conveying unit comprises a rotary cycle apparatus (2), on which said ~~rotationally symmetrical~~ objects (3) are arranged in the circumferential direction and may each be set into rotation by means of a conveyor drive means.
9. (Currently amended) The device according to claim 8, characterized in that wherein said ~~rotationally symmetrical~~ objects (3) are each rotationally journaled with respect to their axis of rotation.
10. (Currently amended) The device according to any one of claims 1 to 9, characterized in that wherein starting signals are generated in the central controller (7), by means of which the processing processes of the individual processing stations may be started individually independently.
11. (Currently amended) The device according to any one of claims 1 to 10, characterized in that, wherein by predetermining the duration of the transmission of said clock pulse to a processing station (B₄-B₈), the duration of the processing process for the function of said processing station (B₄-B₈) may be predefined by the central controller (7).
12. (Currently amended) The device according to any one of claims 8 to 11, characterized in that wherein at least one incremental encoder (13) each is provided for detecting the rotary position of said objects (3).
13. (Currently amended) The device according to claim 12, characterized in that wherein said conveyer drive means for generating generate rotation in dependence upon the signals of said incremental encoder (13) are position controlled.

14. (Currently amended) The device according to ~~any one of claims 1 to 13, characterized in that wherein~~ a lead frequency defining the clock pulse may be preset by said central controller (7).
15. (Currently amended) The device according to claim 14, ~~characterized in that wherein~~ said lead frequency may be adjusted ~~in said controller~~ (7).
16. (Currently amended) The device according to ~~any one of claims 14 or 15, characterized in that said lead frequency is transmitted to a computing unit (9) for synchronizing the rotation of said objects (3) generated by means of said conveyer drive means and to said processing stations (B₄-B₈) for controlling the processing processes.~~
17. (Currently amended) The device according to claim 16, ~~characterized in that wherein~~ said computing unit (9) is stationary ~~arranged~~.
18. (Currently amended) The device according to claim 16, ~~characterized in that wherein~~ said computing unit (9) is arranged on said rotary cycle apparatus (2).
19. (Currently amended) The device according to ~~any one of claims 16 to 18, characterized in that wherein~~ said lead frequency and the signals of said incremental encoders (13) constitute input quantities for the position control of the respective conveyer drive means.
20. (Currently amended) The device according to ~~any one of claims 16 to 19, characterized in that wherein~~ said lead frequency may be adapted to the operating frequencies of said processing stations (B₄-B₈).
21. (Currently amended) The device according to claim 20, ~~characterized in that wherein~~ said lead frequency is ~~adapted to the output frequency constituting~~ an operating frequency of inkjet droplets of an inkjet printing head (6).
22. (Cancelled)

23. (Cancelled)
24. (Cancelled)
25. (Cancelled)
26. (Cancelled)
27. (Cancelled)
28. (Cancelled)
29. (New) A device for processing the surface of an object comprising;
at least one processing station;
a conveying unit, by which said object is transported into desired positions
at said processing station;
a central controller, by which the functions of said conveying unit and said
processing stations are synchronized by presetting a clock pulse being correlated with
the transport of said object, and wherein said central controller controls for each
processing station; and,
wherein said clock pulse is derived from the cyclically and currently
detected position values and detection times of the position values derived from the
transport of the object being processed.
30. (New) The device according to claim 29, wherein the position values and
the detection times of the position values of said objects are detected by an incremental
encoder and stored as data sets in an evaluation unit.
31. (New) The device according to claim 30, wherein said clock pulse for a
processing station comprises a series of counting pulses derived from the data sets
stored in said evaluation unit and follow the increments of the respective incremental
encoder.

32. (New) The device according to claim 31, wherein said counting pulses are generated in a frequency generator controlling a processing station.

33. (New) The device according to claim 32, wherein the output signals generated by said frequency generator are re-read into said central controller.

34. (New) The device according to claim 33, wherein control loops for generating said counting pulses are provided in said central controller, and wherein said re-read output signals of said frequency generators constitute instantaneous values of said control loops.

35. (New) The device according to claim 31, wherein the intervals of the individual counting pulses are shorter than the cycle time of said central controller.
